Photo: Mary E. Nichols, via Realtor.com

> *After an incredible publicity blitz and well over a year on the market, Frank Lloyd Wright's world-renowned Ennis House — tucked into the foothills of Los Feliz [...] — has sold for $18 million to an as-yet-unidentified buyer. That number, while significantly below the $23 million ask, ranks it as the priciest Wright-designed home ever sold, easily eclipsing the previous high-water mark set by the Storer House in nearby Hollywood Hills, which was purchased in 2013 for $6.8 million [...]* — Variety

combinations of flexure and axial load	0.90	0.60
shear	0.80	
bearing	0.60	
anchor bolts: pryout	0.50	
anchor bolts: controlled by anchor bolt steel	0.90	
anchor bolts: pullout	0.65	

TMS 402 Chapter 9 Strength Design $Pu \leq Pn$

Section 9.2 Unreinforced (plain) masonry

9.2.1 Scope

9.2.2 Design criteria (uncracked)

9.2.3 Design assumptions

- strain proportional to distance from N.A.
- flexural tension proportional to strain
- flexural comp. + axial comp. proportional to strain
- stresses in reinforcement are not accounted for

$$f_t = \frac{Mc}{I} - \frac{P}{A}$$

9.2.4 Nominal flexural and axial strength

- compressive stress ≤ 0.80 f'm
- tensile stress ≤ fr

(Equation 9-11) for h/r < 99

$$P_n = 0.80\left\{0.80 A_n f'_m \left[1 - \left(\frac{h}{140r}\right)^2\right]\right\}$$

9.2.5 Axial tension

- tension resistance shall be neglected

(Equation 9-12) for h/r > 99

$$P_n = 0.80\left[0.80 A_n f'_m \left(\frac{70r}{h}\right)^2\right]$$

9.2.6 Nominal shear strength

(3.8 Anv √f'm or 300 Anv)

Reinforced Masonry Analysis - procedure

for axial compression using TMS 402 (2016)
Strength Design (LRFD) – **non-reinforced**

Given: applied load, geometry, material
Find: axial compressive load capacity, Pn

1. Determine the masonry strength, f'm, based on unit strength, fu, and mortar type
2. Find the net area, A_n, and r (see TEK 14-1B)
3. Calculate h/r
4. Choose the axial strength equation, Pn:
   If h/r < 99 use TMS 402 eq.9-11
   If h/r > 99 use TMS 402 eq.9-12
5. Calculate øPn where ø for axial force = 0.60
6. Check that øPn is greater than Pu.

(Equation 9-11) for h/r < 99

$$P_n = 0.80\left\{0.80 A_n f'_m \left[1-\left(\frac{h}{140r}\right)^2\right]\right\}$$

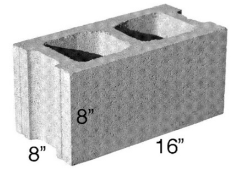
(Equation 9-12) for h/r > 99

$$P_n = 0.80\left[0.80 A_n f'_m \left(\frac{70r}{h}\right)^2\right]$$

Masonry Strength

TMS 602 – Table 2 – s18

Masonry strength, f'm, based on unit strength, fu, and mortar type M, S or N



Concrete Masonry

Table 2 — Compressive strength of masonry based on the compressive strength of concrete masonry units and type of mortar used in construction

Net area compressive strength of concrete masonry, psi (MPa)[1] f'm	Net area compressive strength of ASTM C90 concrete masonry units, psi (MPa)	
	Type M or S mortar fu	Type N mortar
1,750 (12.07)	---	2,000 (13.79)
2,000 (13.79)	2,000 (13.79)	2,650 (18.27)
2,250 (15.51)	2,600 (17.93)	3,400 (23.44)
2,500 (17.24)	3,250 (22.41)	4,350 (28.96)
2,750 (18.96)	3,900 (26.89)	-----
3,000 (20.69)	4,500 (31.03)	-----

[1] For units of less than 4 in. (102 mm) nominal height, use 85 percent of the values listed.

Table 3—8-inch (203-mm) Single Wythe Walls, 1¼ in. (32 mm) Face Shells (standard)

Reinforced Masonry Analysis
for axial compression using TMS 402 (2016) Strength Design – **non-reinforced**

FROM TEK 14-01B FOR 8" CMU
SINGLE WYTHE
HOLLOW BLOCK
GROUT @ 24" O.C.
FACE SHELL MORTAR

3. Calculate h/r

$A_n = 51.3 \text{ in}^2$

$r_{avg} = 2.53 \text{ in}$

$h/r = 12 \; \frac{144''}{2.53''} = \underline{56.92} < 99 \; \therefore \underline{\text{EQ 9-11}}$

4. Choose the axial strength equation, Pn:
   If h/r < 99 use TMS 402 eq.9-11
   If h/r > 99 use TMS 402 eq.9-12

(Equation 9-11) for h/r < 99

$$P_n = 0.80\left\{0.80 A_n f'_m\left[1-\left(\frac{h}{140r}\right)^2\right]\right\}$$

Reinforced Masonry Analysis

for axial compression using TMS 402 (2016) Strength Design – **non-reinforced**

(Equation 9-11) for h/r < 99

$$P_n = 0.80\left\{0.80 A_n f'_m \left[1 - \left(\frac{h}{140r}\right)^2\right]\right\}$$

5. Calculate øPn
   where ø for axial force = 0.60
   (unreinforced)

$$P_n = 0.8\left[0.8 \boxed{A_n f'_m}\left(1 - \frac{h}{140r}\right)^2\right]$$

$$P_n = 0.8\left[0.8\left(51.3\tfrac{in^2}{FT}\right)(3\text{ KSI})\left(1 - \left(\frac{144''}{140(2.53'')}\right)^2\right)\right]$$

$$P_n = 0.8\left[123.12(0.835)\right] = 0.8\left[102.77\right]$$

$$\underline{P_n} = 0.8\left[102.77\right] = \underline{82.2}\ ^K/_{FT}$$

$$\phi P_n = \underset{\phi}{0.6}(82.2\text{ KLF}) = 49.33\text{ KLF}$$

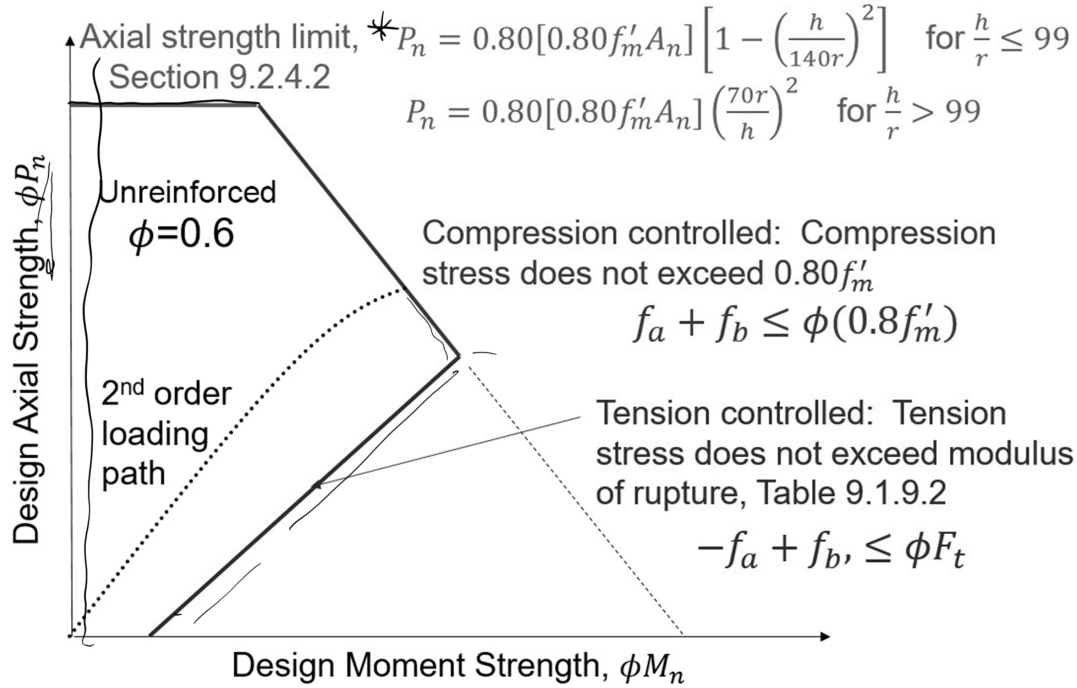
6. Check that øPn is greater than Pu.

$$P_U = \overset{\gamma}{1.2}(\overset{DL}{25\text{ KLF}}) + \overset{\gamma}{1.6}(\overset{LL}{20\text{ KLF}}) = \underline{62}\text{ KLF}$$

$$P_U = \underline{62\text{ KLF} > 49.3}\text{ KLF} = \phi P_n \quad \therefore NG!$$

TMS 402 Chapter 9

Interaction Diagram



TMS 402 Chapter 9

Moment Magnification

Design for magnified moment: $M_u = \psi M_{u,0}$

$$\psi = \frac{1}{1 - \frac{P_u}{P_e}} = \frac{1}{1 - \frac{P_u}{A_n f'_m \left(\frac{70r}{h}\right)^2}}$$

- Can take ψ = 1 if h/r ≤ 45
- Can take ψ = 1 if 45 < h/r ≤ 60 and nominal strength reduced by 10%

Unreinforced Masonry Wall

example

Given:

h = 12 ft

t = 8 in hollow CMU, fu = 2000 psi

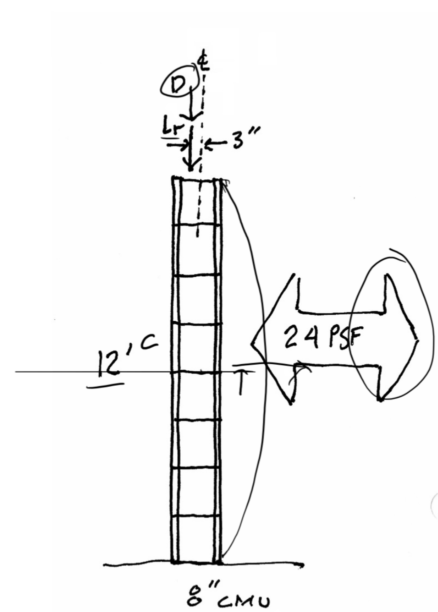
type S mortar, face shell bedding, no grout

Loading:

D = 1 k/ft + selfweight of 30 psf

Lr = 0.5 k/ft (w/ e=3 in.)

W = 24 psf (+ or -)



Load Combinations

1.4D

1.2D + 1.6L$_r$

1.2D + 1.0W + 0.5L$_r$

0.9D + 1.0W *

Unreinforced Masonry Wall
example

f'm = 2000 psi (TMS 602 – table 2 – s18)

WIND

Maximum combined moment, $M_{u,0}$

$$M_{u,0} = \frac{M_{uf}}{2} + \frac{w_u h^2}{8} + \frac{M_{uf}^2}{2w_u h^2}$$

$$= \frac{2700\frac{lb \cdot in.}{ft}}{2} + \frac{24\frac{lb}{ft^2}(12ft)^2\left(12\frac{in.}{ft}\right)}{8} + \frac{\left(2700\frac{lb \cdot in.}{ft}\right)^2}{2\left(24\frac{lb}{ft^2}\right)(12ft)^2\left(12\frac{in.}{ft}\right)}$$

TOTAL

$$= 1350 + 5184 + 88 = 6622\frac{lb \cdot in.}{ft}$$

Unreinforced Masonry Wall example

0.9D + 1.0W - Wind suction (compression on inside face of wall)

9.2.4.3 *P-Delta effects*

9.2.4.3.1 Members shall be designed for the strength level axial load, P_u, and the moment magnified for the effects of member curvature, M_u.

9.2.4.3.2 The magnified moment, M_u, shall be determined either by a second-order analysis, or by a first-order analysis and Equations 9-13 and 9-14.

$$M_u = \psi M_{u,0} \qquad \text{(Equation 9-13)}$$

$$\psi = \frac{1}{1 - \dfrac{P_u}{A_n f'_m \left(\dfrac{70r}{h}\right)^2}} \qquad \text{(Equation 9-14)}$$

9.2.4.3.3 A value of $\psi = 1$ shall be permitted for members in which $h/r \le 45$.

Moment Magnifier:

$$\psi = \frac{1}{1 - \dfrac{P_u}{A_n f'_m \left(\frac{70r}{h}\right)^2}} = \frac{1}{1 - \dfrac{1041\frac{lb}{ft}}{(30\frac{in.^2}{ft})(2000psi)\left(\frac{70\ 2.84}{144}\right)^2}} = 1.01$$

Unreinforced Masonry Wall example

0.9D + 1.0W - Wind suction (compression on inside face of wall)

Moment Magnifier: $\psi = 1.01$

ψ f

Compression Stress:

$$\frac{P_u}{A_n} + \frac{\psi M_{u,0}}{S_n} = \frac{1041\frac{lb}{ft}}{30\frac{in.^2}{ft}} + \frac{1.01(6622\frac{lb\cdot in.}{ft})}{81.0\frac{in.^3}{ft}} = 34.7 + 82.6 = 117.3\,psi$$

Nominal Strength = 0.8(2000 psi) =1600 psi
(f'm)

Design Strength = 0.6(1600 psi) = 960 psi **OK**
ϕ

COMP TENSION

Tension stress:

$$+\frac{P_u}{A_n} - \frac{\psi M_{u,0}}{S_n} = +34.7 - 82.6 = 47.9\,psi\ tension$$

Nominal Strength = 51 psi
(f_r)

Design Strength = 0.6 (51 psi) = 30.6 psi **NG!**
ϕ

Unreinforced Masonry Wall example

0.9D + 1.0W - Wind suction (compression on inside face of wall)

What to do to make wall work? (short of reinforcing wall)

1. Increase wall size, say to 12 in. (Sn = 139.6 in^3/ft). Maximum tensile stress is 12.7 psi.

2. Grout wall. (w-wall = 75 psf; An = 91.5 in^2/ft; Sn = 116.3 in^3/ft; f_r = 163 psi) Maximum tensile stress of 45.3 psi is less than design stress of 0.6(163) = 97.8 psi

3. Use Portland cement/lime or mortar cement (modulus of rupture is 84 psi). Maximum tensile stress of 47.2 psi is less than design stress of 0.6(94)=50.4 psi

4. Use pilasters
